

I cannot open the controller web page

Local network

The controller local web page is available only when the phone or computer is connected to the appropriate network. If the controller is operating as an access point, connect directly to its Wi-Fi. If the controller is connected to a router, the device opening the page should be on the same local network.

Controller address

After connection to the router, the IP address may be assigned automatically. If you are using an old saved address, it may have changed after the router restarted. Check the current address on the controller screen, in the router panel, or in the manner described in the instructions for that model.

Mobile phone

During configuration the phone may try to use mobile data because the controller network has no Internet access. The lack of Internet on that network does not itself indicate a fault. During configuration it is best to stay connected to the controller Wi-Fi and avoid automatic switching to another network.
